

CUES LOCK™

STRUCTURAL POINT REPAIR SYSTEMS THAT CAN BE COMBINED WITH CIPP FOR ENHANCED SOLUTIONS

CUES LOCK™

How CUES LOCK can help you GO THE DISTANCE

CUES offers innovative no-dig sewer line solutions for efficient and reliable repair. CUES LOCK products are designed to be used for stand-alone spot repairs or to enhance quality and simplicity of cured-in-place relining. CUES LOCK products are easy to install, require very little equipment, and most repairs can be carried out in live sewer operating conditions. Proven CUES LOCK technologies do not require digging or external point repair.

STENTS

CUES LOCK Stents provide a quick and easy way to bridge holes, voids, cracks and weakened/broken sections in pipes to help and allow easy installation of any type of cured-in-place pipes through the stents. They also can be used to push sagging or delaminating cured-in-place pipes back into place.

BENEFITS:

- Quick and easy installation allows cured-in-place liners to be designed to partially deteriorated pipe standards instead of fully deteriorated, further reducing the repair costs.
- Effective bridging of cracks, holes and infiltration in host pipes in conjunction with cured-in-place liners.
- Limiting water infiltration into the pipe allows cured-in-place pipe to cure without washing away the resin.

STRUCTURAL & SEALER SLEEVES

CUES LOCK Structural & Sealer Sleeves restore damaged areas to full structural strength and seal infiltration.

Structural & Sealer Sleeves can be used as a stand-alone spot repair or in conjunction with cured-in-place liners.

BENEFITS:

- CUES LOCK Structural & Sealer Sleeves aid structural spot repair of damaged pipes and restore the integrity of host pipe to full structural strength prior to relining.

END SEALERS

CUES LOCK End Sealers are used to seal the annular space between the cured-in-place liner and the host pipe at the pipe ends. They prevent the ends of the cured-in-place liner from delaminating or sagging from the host pipe.

BENEFITS:

- Seals the annular space between the cured-in-place liner and the host pipe at the pipe ends.
- Prevents the ends of the cured-in-place liner from delaminating or sagging from the host pipe.
- Can be installed prior to cured-in-place installation or after, depending on the application.
